

Fuel card management system for petrol station

Fuel card management system for petrol stations is intended for management and account over use of fuel cards (fleet cards) as a payment cards for gasoline, diesel and other fuels and also accompanying products at gas stations (petrol stations).

System uses modern technology POS terminal for reading of data from the fuel card, processing customer fuel cards (entering PIN code, selecting of operation type, entering customer information, etc), communication with a centralized server through build-in GSM/GPRS modem, printing of receipts.

Characteristics of the fuel cards management system for petrol stations:

- Fuel card system operates in ONLINE mode - fuel card serves only as identifier, information about cardholder account is stored only in central server, which makes the system highly secured
- Ease of operation on payment using fuel cards for fuel and accompanying products
- GSM/GPRS communication channel between card terminal installed at petrol station and central server
- Communication is made using a proprietary highly secured communication protocol using encryption
- Each caldholder account can store points (money) purse and fuel purses (for prepaid fuel)
- Detailed account of all sales using fuel cards on all petrol stations
- Access to personal cards accounts using a standard web-browser (reception of reports on operation)
- Possibility to set daily, weekly, monthly limits on volumes of purchased fuel using fuel cards
- Possibility to set customer identification policies with storing various information about cardholders: vehicle number, vehicle odometer value, car model name, etc with its verification when using fuel card at petrol station
- Possibility to organize various bonus programs using fuel cards
- Possibility to organize various discount programs using fuel cards
- Possibility to refill accounts of fuel cards at any petrol station
